Micro Learning Video: GDSP Specimen Location in Hierarchy

In this video, you will learn the hierarchy between Patient, Case, and Specimen record.

1. Each patient will have a case and each case a specimen. With this nested structure, updates made on one record will be reflected across all related records.
2. The Patient record informs the Case record and the Specimen record.
3. The Patient record contains a broader set of information than both the case and specimen records.
4. Click the Case ID to navigate to the Case record.
5. Case records are more focused than the Patient records.
6. Click the Accession # to navigate to the Specimen record.
7. Specimen records will be the most detailed and focused on information related to that specific specimen.
