* This table excludes Long-term and Rehabilitation Acute Care Hospitals.

^a SIR is the standardized infection ratio of reported hospital onset (HO) cases to the NHSN-predicted number of HO cases adjusted for significant risk factors. An SIR is produced by NHSN when at least one infection is predicted.

[¶] SIR was calculated by CDPH if the predicted number of infections was less than 1 and greater or equal to 0.2. The SIR and its comparison are not as accurate as SIRs based on a larger number of predicted infections. For a detailed explanation, please see the Technical Notes.

^b If the 95% Confidence Interval (CI) for the SIR includes 1, the number of reported cases is not statistically significantly different from that predicted.

^c This column shows if the 95% CI indicates an infection count significantly higher, lower, or no different than predicted.

^{¶¶} Hospitals with data presented for only 6 or 9 months of the year in 2015; data from hospitals that reported extreme outlier community-onset *C. difficile* prevalence rate for certain quarters of the year were excluded from further analyses for those quarters.

Source: *Clostridium difficile* Infections in California Hospitals, January through December 2015 California Department of Public Health.

** PCR: [+] = Hospital used PCR, [] = Hospital did not use PCR in 2015. PCR testing is more sensitive than other testing methods and therefore may increase the number of cases of CDI identified.

Note: Rate per 10,000 patient days; 95% exact confidence intervals calculated based on Poisson distribution
