

# CalScope Wave 1 Findings

## What is CalScope?

CalScope is a population-based seroprevalence study that helps the California Department of Public Health learn how many Californians have antibodies (from a past infection or vaccination) to SARS-CoV-2, the virus that causes COVID-19.

One adult and one child from each randomly selected household were invited to self-collect a blood sample at home and complete an anonymous survey.

Wave 1 of CalScope was conducted from May-June 2021

## Wave 1 Enrollment

**11,000+**

Households enrolled in 7 counties

**Completed Antibody Test and Survey**

7,483 Adults (18+ years)

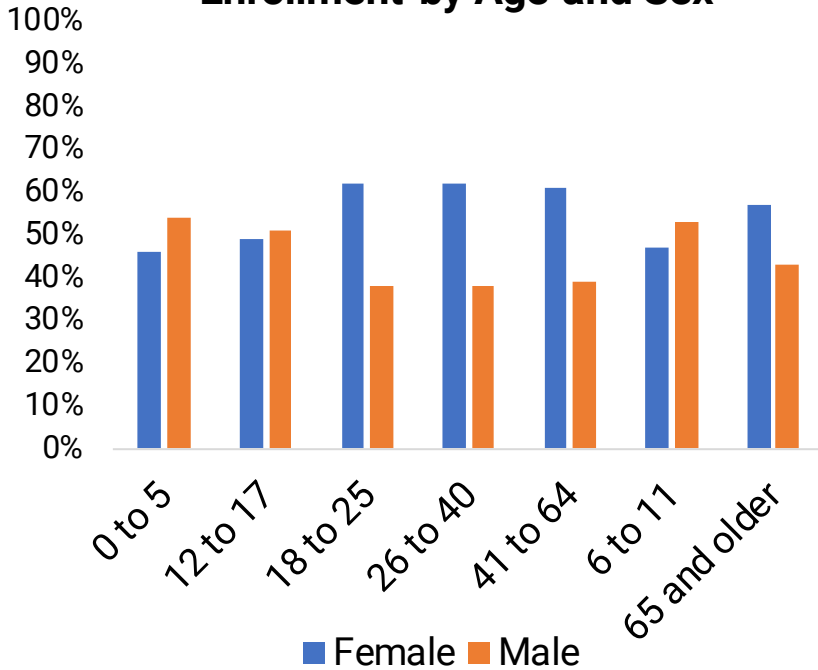

1,375 Children (0-17 years old)

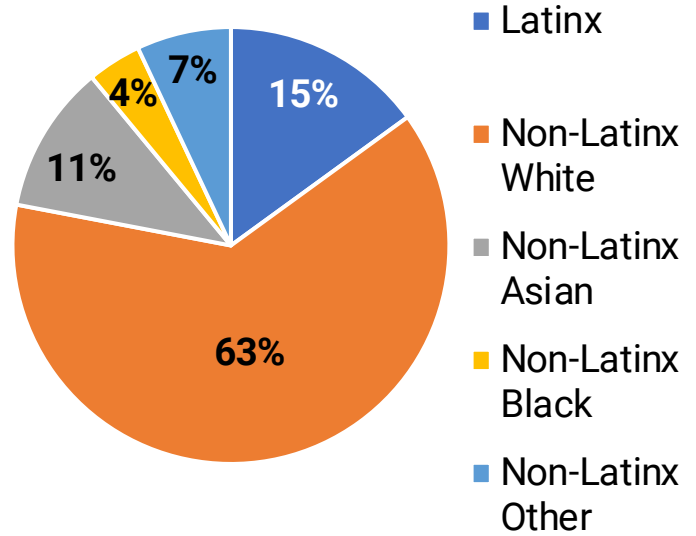

# CalScope Wave 1 Findings

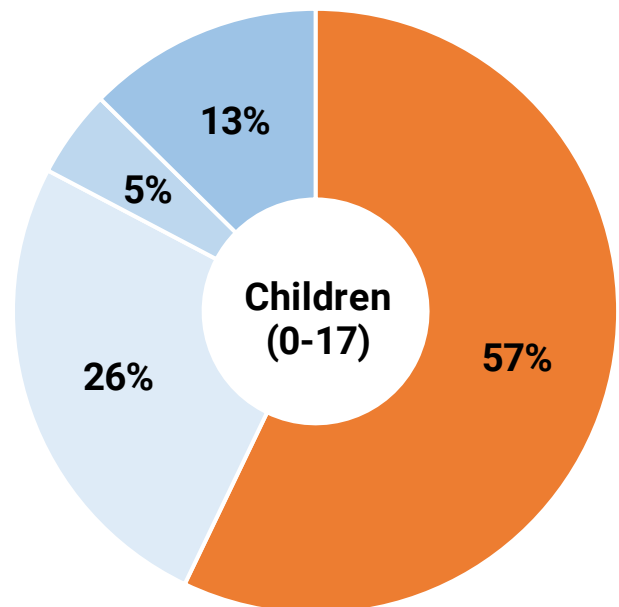

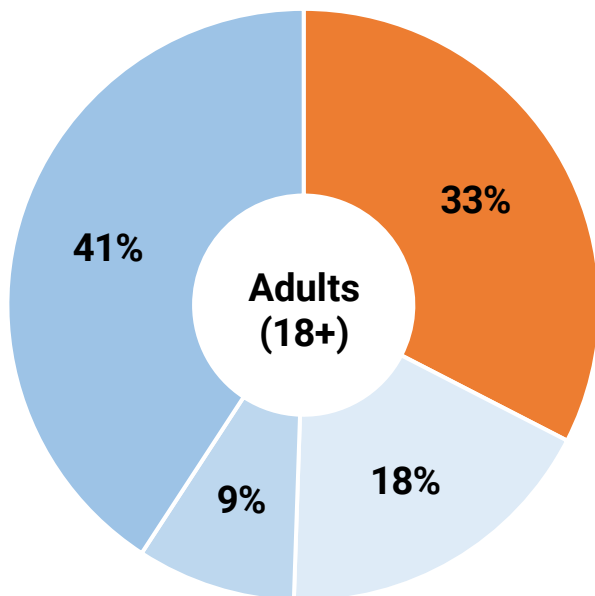

### Enrollment by Age and Sex

### Enrollment by Race/Ethnicity

## Antibody status of participants based on COVID-19 antibody results and self-reported vaccination history (May – June 2021)

■ No Antibodies   
 ■ Infection Only   
 ■ Infection and Vaccination   
 ■ Vaccination Only
