Statewide, 1.89% of children age < 6 years who were tested in 2012 had blood lead levels of => 4.5 µg/dL.

*Additional notes for blood lead data

Data is for children age < 6 years who had a BLL during 2012.

Based on RASSCLE surveillance database archive of 01/11/2015.

Counts are for blood lead levels expressed in micrograms per deciliter (µg/dL or mcg/dL) of whole blood.

Top 200 California Zip Codes with Blood Lead Levels (BLLs) at and above 4.5 micrograms per deciliter, for children less than age 6, with at least 500 children tested, 2012*

Zip	County	Location	Children tested age < 6	Children Age < 6 with BLLs >=4.5	%
					Children Age < 6 with BLLs >= 4.5

Levels of ≥ 4.5 $\mu\text{g}/\text{dL}$ are higher than that of most California children.

Blood lead values are rounded up to the nearest whole integer for the purposes of reporting by the CDPH CLPPB.

Results are for individual children age younger than age 6 years at the time of their test, not total tests.

Each individual is counted only once during each time period, using their highest level during that period.

The child's residence at the time of blood lead level is the one counted.

Results later determined to be false positives or errors have been excluded.

It was not possible to determine the zip code for all children's residences.

A zip code may not be in the table for several reasons. The zip code may have children with BLLs ≥ 4.5 but not enough to be in the top 200 zip codes; there may be fewer than 500 children tested in that zip code; or there were no BLLs ≥ 4.5 .

Data should be considered as preliminary and subject to revision.
