

In recent incidents, two machine operator helpers, 18-year-old Pedro N.*, and 37-year-old Jaime C.*, died while helping co-workers operate steel slitting machinery. Both apprentices were crushed in between layers of steel being wound into large rolls. Pedro and Jaime were pulled into the steel slitting machines when they got caught in the moving steel. There were no barriers or safety interlock devices that prevented the workers from entering the unsafe areas of the machines where they were killed.

WHAT WENT WRONG?

WHAT SHOULD BE DONE?

The steel slitting machines had open areas (pinch points) where the workers were caught in moving parts or steel.

Machine pinch points should be physically guarded or have safety interlock systems.

Pedro and Jaime worked too close to large, unprotected, fast-moving rolls of steel.

Workers should not operate or work near running machinery pinch points if the machinery has no guarding/interlock, or if the guarding/interlock is defective, or if it has been bypassed.**

The California Fatality Assessment and Control Evaluation (FACE) program has been investigating work-related deaths since 1992. The goal of the FACE program is to prevent these deaths by informing workers and managers of worksite hazards and how to avoid them.

For complete fatality reports of these (05CA003 & 06CA002), or other cases, and additional information on the California FACE program, contact:

California Department of Public Health

Occupational Health Branch (OHB), FACE Program 850 Marina Bay Parkway, Building P, 3rd Floor, Richmond, CA 94804 (510) 620-5757
