

Clostridioides difficile Infection Prevention

Infection Preventionist Training for Skilled Nursing Facilities
Healthcare-Associated Infections Program
Center for Health Care Quality
California Department of Public Health

Objectives

- Describe the cause and epidemiology of *Clostridioides difficile* infection (CDI)
- Review evidence-based CDI prevention strategies
- Describe importance of adherence monitoring and feedback

Clostridioides difficile

- An anaerobic, gram-positive, spore-forming, toxin-producing bacillus
- Transmitted among humans via the fecal-oral route
- The cause of *Clostridioides difficile* infection (CDI); severity ranges from mild diarrhea to severe intestinal infection (colitis); death in up to 9% of cases
- The leading cause of antibiotic-associated colitis in adults, in both acute and long-term care settings

Leffler and Lamont. *New Engl J Med* ;372:1539-48, 2015

Lessa, et al. *New Engl J Med* ;372:825-34, 2015

Laffan, et al. *J Am Geriatr Soc* ;54(7):1068-73, 2006

U.S. CDI Burden

Figure 1. Estimated U.S. Burden of *Clostridium difficile* Infection (CDI), According to the Location of Stool Collection and Inpatient Health Care Exposure, 2011.

Of the estimated cases of community-associated CDI, 82% were estimated to be associated with outpatient health care exposure.¹¹ CO-HCA denotes community-onset health care-associated infection, HO hospital onset, and NHO nursing home onset.

Healthcare-Associated CDI in California

- *C.difficile* is the most frequently reported HAI by California hospitals
 - 4,886 hospital-onset CDI reported in 2019
- Patients often cycle between multiple hospitals, long term acute care, and long term care facilities
 - 26% of CDI patients in Orange County were readmitted to another facility within 12 weeks of discharge

2020 CDI Prevention Goal for Hospitals

- National HAI Prevention Action Plan target goal:
 - 30% CDI reduction from 2015 baseline
 - 2019: California hospitals have surpassed target goal - 48% decrease in CDI from 2015
 - Recommended by the CDPH HAI Advisory Committee for all California hospitals
 - No baseline CDI data for SNF at this time in order to determine a reduction goal
 - Prevention strategies are still important to SNF

C. difficile Pathogenesis

The following events may take place separately and in any order, but both are required for CDI to occur.

Ingest *C. difficile* spores transmitted to patients via the hands of healthcare personnel and environment

Spores germinate into a growing vegetative form

Changes in lower intestinal flora due to **antimicrobial use** allows proliferation of *C. difficile* in colon

Toxin A & B production leads to colon damage

Two Preventable Events in CDI

The following events may occur separately and in any order, but **both are required for infection to occur:**

1. The normal **intestinal flora must be compromised** (for example, due to antibiotics) allowing for *C.difficile* to establish itself and proliferate
2. **C.difficile bacteria or spores must be ingested**

Sunenshine et al. Cleve Clin J Med;73:187-97, 2006

Risk Factors for CDI

- Acquisition of *C. difficile* bacteria (*Modifiable risk factor*)
- Antimicrobial exposure (*Modifiable risk factor*)
- Advanced age
- Immunosuppression
- Tube feedings
- Gastric acid suppression
- Prolonged stay in healthcare facility
- Inflammatory bowel disease
- GI surgery

CDI Diagnosis

- Presence of symptoms, usually diarrhea
 - ≥ 3 unformed stools over 24 hours (specifically, stool conforms to shape of container)
- Positive stool test for *C. difficile* or toxins
- Diagnostic imaging
 - Endoscopic or histologic (for example, pseudomembranous disease)
- CDI relapse occurs in 10-25% cases

Cohen, S., Clostridium difficile Infection: Current Challenges and Controversies, 2008

CDI Testing

- Only test patients with clinically significant diarrhea without other identified causes
 - Consider alternate etiologies for diarrhea
 - Discontinue laxatives for 24-48 hours and reevaluate prior to testing
- Use laboratory-based system for **immediate notification** of positive CDI test results
- Single stool specimen at onset of symptoms is sufficient
- Repeat testing is of limited value; “test of cure” is not recommended

IDSA Clinical Practice Guidelines for CDI Update 2018

Clinical Infectious Diseases

IDSA GUIDELINE

Clinical Practice Guidelines for *Clostridium difficile* Infection in Adults and Children: 2017 Update by the Infectious Diseases Society of America (IDSA) and Society for Healthcare Epidemiology of America (SHEA)

L. Clifford McDonald,¹ Dale N. Gerding,² Stuart Johnson,^{2,3} Johan S. Bakken,⁴ Karen C. Carroll,⁵ Susan E. Coffin,⁶ Erik R. Dubberke,⁷ Kevin W. Garey,⁸ Carolyn V. Gould,¹ Ciaran Kelly,⁹ Vivian Loo,¹⁰ Julia Shaklee Sammons,⁶ Thomas J. Sandora,¹¹ and Mark H. Wilcox¹²

¹Centers for Disease Control and Prevention, Atlanta, Georgia; ²Edward Hines Jr Veterans Administration Hospital, Hines, and ³Loyola University Medical Center, Maywood, Illinois; ⁴St Luke's Hospital, Duluth, Minnesota; ⁵Johns Hopkins University School of Medicine, Baltimore, Maryland; ⁶Children's Hospital of Philadelphia, Pennsylvania; ⁷Washington University School of Medicine, St Louis, Missouri; ⁸University of Houston College of Pharmacy, Texas; ⁹Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, Massachusetts; ¹⁰McGill University Health Centre, McGill University, Montréal, Québec, Canada; ¹¹Boston Children's Hospital, Massachusetts; and ¹²Leeds Teaching Hospitals NHS Trust, United Kingdom

A panel of experts was convened by the Infectious Diseases Society of America (IDSA) and Society for Healthcare Epidemiology of America (SHEA) to update the 2010 clinical practice guideline on *Clostridium difficile* infection (CDI) in adults. The update, which has incorporated recommendations for children (following the adult recommendations for epidemiology, diagnosis, and treatment), includes significant changes in the management of this infection and reflects the evolving controversy over best methods for diagnosis. *Clostridium difficile* remains the most important cause of healthcare-associated diarrhea and has become the most commonly identified cause of healthcare-associated infection in adults in the United States. Moreover, *C. difficile* has established itself as an important community pathogen. Although the prevalence of the epidemic and virulent ribotype 027 strain has declined markedly along with overall CDI rates in parts of Europe, it remains one of the most commonly identified strains in the United States where it causes a sizable minority of CDIs, especially healthcare-associated CDIs. This guideline updates recommendations regarding epidemiology, diagnosis, treatment, infection prevention, and environmental management.

Keywords. *Clostridium difficile*; *Clostridioides difficile*; Guidelines; CDI; CDAD.

Test Recommendations Algorithm

Clinicians and lab personnel agree at the institutional level to **not submit stool specimens on patients receiving laxatives** and to submit stool specimens only from patients with unexplained and new onset ≥ 3 unformed stools in 24hr for CDI Testing

NO

Stool toxin test* as part of a multiple step algorithm, (GDH plus toxin; GDH plus toxin, arbitrated by NAAT; or NAAT plus toxin) rather than a nucleic acid amplification test (NAAT) alone

YES

NAAT alone OR stool toxin test* as part of a multiple step algorithm (GDH plus toxin; GDH plus toxin arbitrated by NAAT; or NAAT plus toxin), rather than a toxin test alone

*Approved stool EIA toxin tests vary widely in sensitivity. Lab should choose a toxin test with sensitivity in the upper range of sensitivity as reported in literature.

Preventing CDI: The MOST Important Things

Prevent C. difficile Acquisition / Reduce Antimicrobial Exposure

- Isolate patients with diarrhea pending CDI confirmation
- Lab alert system** for immediate notification of positive CDI tests
- Contact precautions** for duration of diarrhea plus 48 hours
 - Private room, dedicated toilet
 - Gloves/gown to enter room
 - Remove gloves, perform hand hygiene prior to room exit
- Hand hygiene** before/after patient contact & after glove removal
 - Patient hand hygiene
- Disposable equipment**
- Sporicidal disinfectant** for cleaning reusable equipment
- Sporicidal disinfectant for **terminal** cleaning
- Quality cleaning**, daily & terminal
- CDI-targeted **antimicrobial stewardship program**
 - Improve overall prescribing, stop unnecessary antibiotics
 - Restrict high-risk antibiotics based on local epidemiology
 - Stop inciting antibiotic

Contact Precautions for CDI

Place on Contact precautions for duration of diarrhea

- Extend contact precautions beyond duration of diarrhea (Example: for 48 hours after diarrhea ceases)
- Emphasize **glove use** and removal of gloves prior to exiting room of CDI patient
 - Gloves are effective at preventing *C.difficile* contamination of hands
 - Adherence to glove use is critical to preventing *C.difficile* transmission via hands of health care providers
- Emphasize compliance with **hand hygiene**

Contact Precautions – Special Approaches

When CDI rates remain high or during an outbreak, **isolate patients with diarrhea pending CDI confirmation**

- Rationale: Patients with CDI may contaminate the environment and hands of health care providers before results of testing are known.
- For patients with possible recurrent CDI, isolate and test following first unformed stool

Hand Hygiene for CDI

Perform hand hygiene before and after contact with CDI patient **and after removing gloves**

- Routinely use alcohol hand rub **or** soap and water
 - *C. difficile* spores are resistant to alcohol; however, studies did not find increases in CDI with alcohol-based hand hygiene, but several did find reductions in MRSA or VRE
- Use **soap and water** during CDI outbreak, “hyper-endemic setting,” or hand fecal contamination
 - **Be aware:** Hand hygiene adherence may decrease when soap and water is the only option provided

Hand Hygiene and Gloves – Special Approaches

When CDI rates **remain high** or during an outbreak, **implement universal glove use** for facilities or units with high CDI rates

- Rationale: *C.difficile* spores are difficult to remove even with hand washing.
- Asymptomatic carriers play a role in transmission (though magnitude of contribution unknown)
- Adherence to glove use with or without contact precautions is critical to preventing *C. difficile* transmission via hands of health care providers

CDI-Targeted Antimicrobial Stewardship

Implement an **antimicrobial stewardship program (ASP)**

- Goal: Minimize the **frequency** and **duration** of antimicrobials and the **number** of antimicrobials prescribed.
- Target antimicrobials based on local epidemiology
 - Restricting fluoroquinolones, cephalosporin, and clindamycin has been effective
- Reduce use of broad-spectrum antibiotics
 - Enforcing a narrow-spectrum antibiotic policy with feedback to prescribing physician resulted in significant CDI reduction in 3 acute geriatric medical wards

Fowler et al. J Antimicrob Chemother 2007;59:990-5.

CDI-Targeted Antimicrobial Stewardship - continued

- Increased risk of CDI has been linked to specific antibiotics

High Risk	Medium Risk	Low Risk
Aminopenicillins	Beta-lactam/beta-lactamase inhibitors	Macrolides
Clindamycin	Carbapenems	Trimethoprim/ sulfamethoxazole
Cephalosporins		Tetracyclines
Fluoroquinolones		

Dubberke, et al. Infect Contr Hosp Epidemiol. 2014;35(6):628-645
Price, et al. Clin Microbiol Infect. 2010;16(8):1297-302

Examples of CDI-Targeted ASP Interventions

- Formulary restriction and prospective audit with feedback
 - Target antibiotic(s) most associated with CDI at your facility
 - Recommend lower-risk alternatives, and optimizing dosing, route, and duration of therapy
- Target patients with CDI diagnoses for medication review to identify and discontinue unnecessary antibiotics

ASP Interventions Reduce Risk of *C. difficile* Transmission

- Improved overall antimicrobial prescribing

- Stopping unnecessary antibiotics in patients with new CDI diagnoses

California Antimicrobial Stewardship Initiative

- CDPH HAI Program activity
- Objective: Assist California hospitals and long-term care facilities with optimizing antimicrobial use to improve patient outcomes
- [CDPH Antimicrobial Stewardship Program Initiative web page](http://www.cdph.ca.gov/Programs/CHCQ/HAI/Pages/CA_AntimicrobialStewardshipProgramInitiative.aspx)
(www.cdph.ca.gov/Programs/CHCQ/HAI/Pages/CA_AntimicrobialStewardshipProgramInitiative.aspx)

Environmental Cleaning and Disinfection

- Patients with CDI can shed bacteria and spores into the environment both during *and after* treatment of CDI
- Ensure thorough daily and terminal cleaning of patient care areas
 - Focus on **high-touch** surfaces and the bathroom
- **Assess adequacy of cleaning**
 - Study in 3 hospitals used fluorescence to assess cleaning
 - Only 47% of high-touch surfaces cleaned

Equipment

- Identify and **remove unnecessary** equipment that can be environmental sources of *C.difficile* transmission
 - Use **disposable** equipment when possible
 - Ensure **reusable equipment** is cleaned with a **sporicidal disinfectant**

Environmental Cleaning and Disinfection- Special Approaches

When CDI rates remain high or during an outbreak, use a **sporicidal disinfectant** for daily and terminal cleaning (for example, bleach), in conjunction with other measures

- Limited data suggest cleaning with bleach (1:10 dilution prepared fresh daily) reduces *C. difficile* transmission
- Two before-after studies showed benefit on units with high endemic CDI rates
- Sporicidal disinfectants may be most effective in reducing burden where CDI rates high

CDI in the Hospital Environment

C. difficile Transmission from Prior Room Occupants

110%
Increased
risk

Shaugnessey et al. Abstract K-4194
IDSA / ICAAC. October 2008

Infection Prevention Role in CDI Prevention

- Ensure policies reflect current evidence-based practice recommendations
- Ensure staff competency upon hire and at least annually (Examples: new hire orientation, annual skills fair, return demonstration to ensure competency)
- Establish an **adherence monitoring program** for core care practices
 - Use available adherence monitoring tools
 - Ensure feedback provided to frontline staff
- Present adherence results and CDI incidence to leaders

Adherence Monitoring Tool – Contact Precautions

Regular monitoring with feedback of results to staff can maintain or improve adherence to contact precautions practices. Use this tool to identify gaps and opportunities for improvement. Monitoring may be performed in any type of patient care location where patients are on contact precautions.

Instructions: Observe 3-4 patients/residents on contact precautions. Observe each practice and check a box if adherent, Yes or No. In the column on the right, record the total number of “Yes” for adherent practices observed and the total number of observations (“Yes” + “No”). Calculate adherence percentage in the last row.

Contact Precautions Practices		Contact Precautions Patient/Resident 1		Contact Precautions Patient/Resident 2		Contact Precautions Patient/Resident 3		Contact Precautions Patient/Resident 4		# Yes	# Observed
		<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No		
CP1.	Gloves and gowns are available and located near point of use.	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No

If practice could not be observed (i.e. cell is blank), do not count in total # Observed.

Adherence Monitoring Tool – Environmental Cleaning and Disinfection

Regular monitoring with feedback of results to staff can maintain or improve adherence to environmental cleaning practices. Use this tool to identify gaps and opportunities for improvement. Monitoring may be performed in any type of patient care location.

Instructions: Observe at least two (2) different environmental services (EVS) staff members. Observe each practice and check a box if adherent (“Yes”) or not adherent (“No”). In the right column, record the total number of “Yes” responses for adherent practices observed and the total number of observations (“Yes” + “No”). Calculate adherence percentage in the last row.

Environmental Cleaning Practices		EVS Staff 1	EVS Staff 2	EVS Staff 3	Adherence by Task	
					# Yes	# Observed
ES1.	Detergent/disinfectant solution is mixed and stored according to manufacturer’s instructions.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES2.	Solution remains in wet contact with surfaces according to manufacturer’s instructions.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES3.	Cleaning process avoids contamination of solutions and cleaning tools; a clean cloth is used in each patient area, and the cloth is changed when visibly soiled.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES4.	Standard cleaning protocol is followed to avoid cross-contamination (e.g. from top to bottom, patient room to bathroom, and clean to dirty)	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES5.	Environmental Services staff use appropriate personal protective equipment (e.g. Gowns and gloves are used for patients/residents on contact precautions upon entry to the Contact precautions room.)	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES6.	Hand hygiene is performed throughout the cleaning process as needed, including before and after glove use.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES7.	High-touch surfaces* are thoroughly cleaned and disinfected after each patient. Mark “Yes” if Fluorescent Marker Assessment Tool result is 100%; mark “No” if <100%.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES8.	There are no visible tears or damage on environmental surfaces or equipment.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		
ES9.	The room is clean, dust free, and uncluttered.	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No	<input type="checkbox"/> Yes <input type="checkbox"/> No		

***Examples of high touch surfaces:**

Bed rail	Chair	Room light switch	TV remote	Bathroom door knob/handle	Bathroom sink
Tray table	In-room medical cart	IV pole (“grab area”)	Room inner door knob/handle	Bathroom handrail	Bathroom faucet
Side table	Room sink	Call button	In-room cabinet	Bathroom light switch	Toilet flush handle
Side table handle	Room sink faucet	PPE container	In-room computer/keyboard	Toilet seat	Toilet/bedpan cleaner

of Correct Practice Observed (“# Yes”): _____

Total # Environmental Services Observations (“# Observed”): _____

Adherence _____%

(Up to 15 Total)

(Total “# Yes” ÷ Total “# Observed” x 100)

If practice could not be observed (i.e. cell is blank), do not count in total # Observed.

Provide Feedback on Adherence Monitoring

- Share adherence monitoring results and CDI incidence with unit staff
- Present results to managers and leadership
 - Use data to focus prevention efforts
 - Use data to get needed resources
